

Import data from the Make-a-Mammal database (installing if you haven't already) by selecting the following tables:

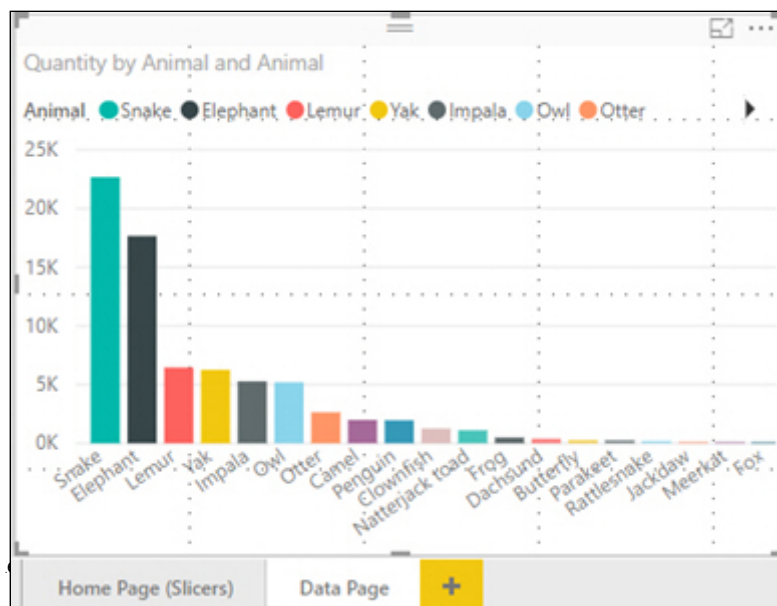

Power BI should import the relationship. If it doesn't, connect the **ProductID** fields in both tables.

The goal is to create a report with one page of slicers which filter a second page containing no slicers but has a table. Create the first page like this:

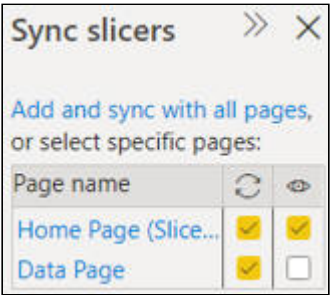

A variety of slicers including: a vertical dropdown, horizontal list and numeric slider.

Then add a page that has a visualisation containing the **Quantity** sales for the **Animal** column.

To have filters affecting other pages, we can turn on **Sync Slicers** on the view tab:

The left-hand column determines which slicers will have their values synced, while the right-hand eye column specifies on which pages slicers can be seen.

Repeat for each slicer then save as **Synchronised swimi...err Slicing.pbix**.
