

The aim of this exercise is to show the total value of transactions according to the day of the week:

Row Label: ▾	Sum of Quantity
Monday	2760
Tuesday	2735
Wednesday	2594
Thursday	2561
Friday	2741
Saturday	2862
Sunday	2763
Grand Total	19016

It looks like Saturday was the most popular day, but not by much.

Here's what the PowerPivot field list should look like (eventually!):

Transaction
<input checked="" type="checkbox"/> Quantity
<input checked="" type="checkbox"/> Weekday

*The two fields of interest for our pivot table. Note that we've used the **RELATED** function to combine them into a single table, to make the field list look neater.*

To start, if you haven't already done so run the script in the above folder to generate the **MAM** database (not for commercial use or copying), then create a new workbook.

Connect to the **tblTransaction** and **tblPos** tables (giving them friendly names), and in what is now the **Pos** table create a new calculated column which gives the weekday. For example:

		<i>fx</i>	=format([PosDate],"dddd")
	PosDate	PosWeekday	StaffId
5	19/08/20...	Tuesday	33
8	30/10/20...	Wednesday	33
0	09/03/20...	Sunday	33
9	22/12/20...	Monday	33
8	17/12/20	Wednesday	33

You can use the **FORMAT** function to get the weekday corresponding to any date.

Now use the **RELATED** function in the **tblTransaction** table to show the weekday alongside the quantity sold, and use this to create the pivot table at the start of this exercise.

PosId	Quantity	Weekday
36783	1	Wednesday
36800	1	Monday
36907	1	Friday
36918	1	Tuesday
36987	1	Thursday
36995	1	Sunday

Your formula should start **=RELATED(**.

To get the pivot table to sort the days correctly, just sort by the day name:

3	Row Labels	Sum of Quantity
A↓	Sort A to Z	
Z↓	Sort Z to A	
	More Sort Options...	
	Clear Filter From "Weekday"	

Click on the row labels drop down and choose to sort A to Z. As to why this works - wait for the calendar part of the course!

Save this workbook as **Daily sales**, then close it down.
