

Create a new Power BI file, and run the SQL script in the above folder to generate the **Make-a-Mammal** database (there's obviously no need to do this if you already have it on your computer). Load the tables **tblCentre**, **tblFamily**, **tblProduct**, **tblPurchase** and **tblTown**.

Create a map showing the sales by family for each town, but only for shopping centres having at least 100,000 square metre size:

*You'll need to geocode the towns to tell Power BI Desktop they're in the UK, and also increase your bubble size to about 50%.*

Save this file as **Trivial Pursuits**, and close down this instance of Power BI Desktop.
