

Import the **Events**, **Category** and **Country** tables from the **WorldEvents.xlsx** file, found in the above folder. Look in **Relationship View** to see what has happened.

Annoyingly, no relationships have been created between the tables. There are two ways we can handle this.

The first method is longer but gives a greater level of control. On the home tab of the tool bar find **Manage Relationships**.

*If only it was as easy as clicking one button....in this case it is! Choose **New..** .*

This will create a window where there are two drop downs. From these select the two tables you want to join together. It doesn't matter the order in which you choose them.

Create relationship

Select tables and columns that are related.

Country

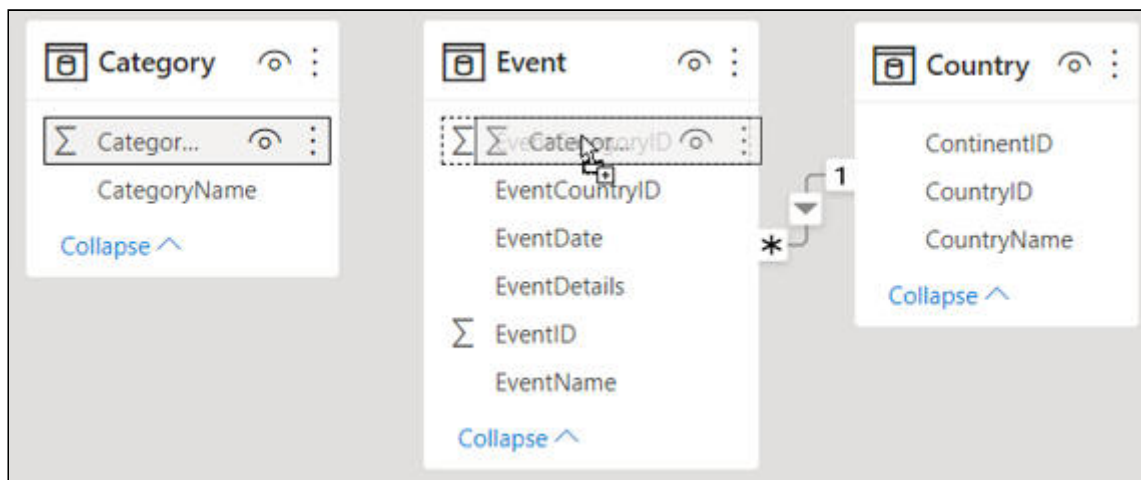

CountryID	CountryName	ContinentID
1	Ukraine	3
2	France	3
3	Germany	3

Event

	EventDetails	EventDate	EventCountryID	EventCategoryID
on Germany	Following Germany's invasion of Poland, the UK's Prime...	03/09/1939	7	6
	By a narrow majority Britain votes to leave the Europea...	23/06/2016	7	1
es	Widely considered a success, the London Olympics star...	27/07/2012	7	7

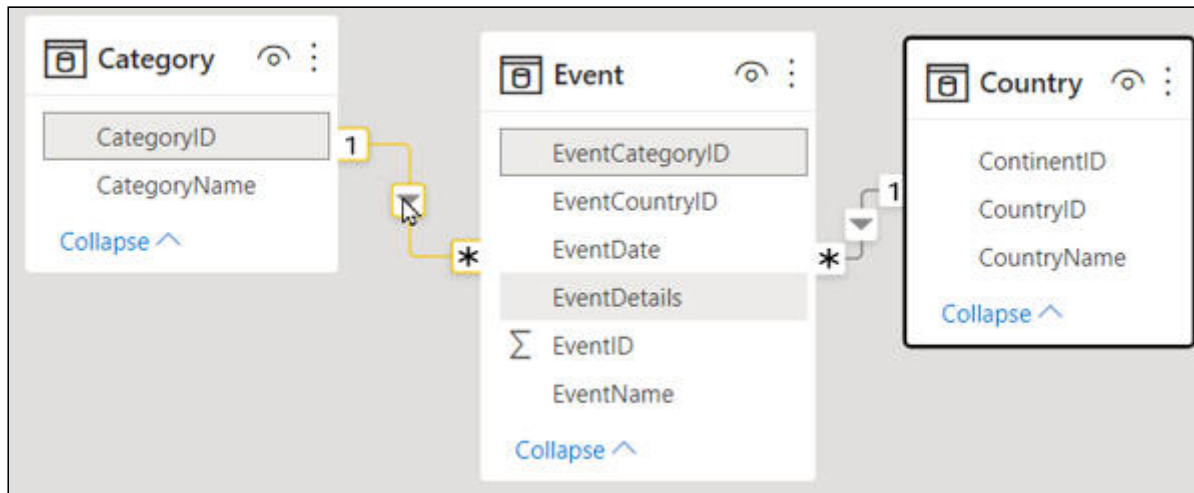

Click on a column from each table to create a join. In this case each event has a corresponding country. **EventCountryID** and **CountryID** pair up!

First relationship done! The other way to create one is to click and drag from one column to the other. Try dragging the **CategoryID** to the **EventCategoryID**.

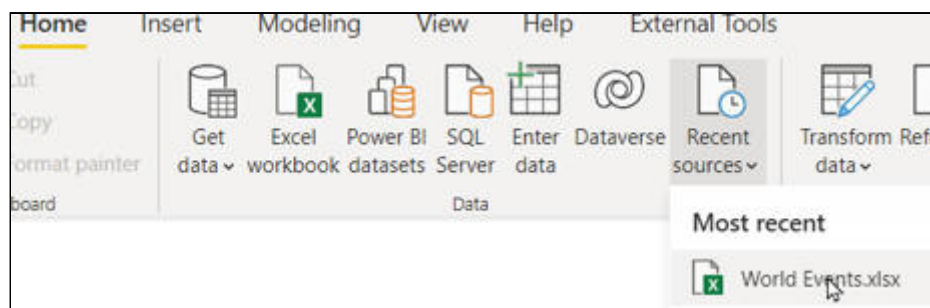

Thankfully most of the time the names of columns make it clear what the overlap is. Modern databases have a tendency to even use the exact same column name.

The danger of this method is if you miss. To check which columns have been joined let your mouse hover over the line you have just created. Power BI will highlight the two joined columns:

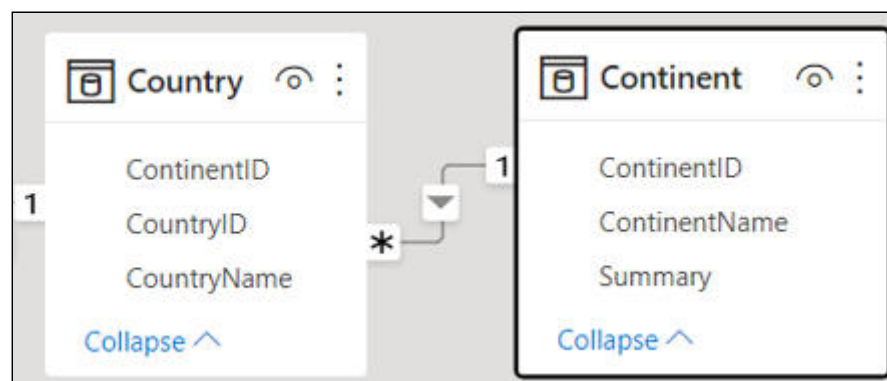

The **1** means that **CategoryID** only has unique values while the ***** means **EventCategoryID** has duplicates (ie more than one event can be in the same category).

How daft, there was another table we wanted from that excel document! Not to worry - there is a shortcut to reconnect to the file. Find **Recent Sources** on the home tab.

Connect to previous sources quickly without the hassle of all the browsing!

Bring in the **Continent** table - this should automatically create a join too:

A relationship has been auto created since they have the same field names, data types and one is unique. Excellent!

Optionally save this as **Creating cultural connections.pbix** and close it down.
