

Create a new Power BI report. Load the worksheets from the workbook in the above folder, and use them to create a data model:

Your data model should only include columns you might want to display in reports.

Now create a table and matrix, such that when you click on a continent (such as **Africa** for this example) you see the number of events in each of its countries, by year:

Choose a continent

Continent

Africa

Antarctica

Asia

Australasia

Europe

North America

Not applicable

South America

Number of events

Year	Egypt	Ghana	South Africa	Zimbabwe	Total
1990			1		1
1975	1				1
1967			1		1
1965				1	1
1960			1		1
1957	1	1			2
1956	1				1
1799	1				1
Total	4	1	3	1	9

Your matrix should count the number of events for each year and country.

Save this report as **Out of Africa**, then close it down.
