With more *Pokémon* being added all the time, it's time to clean up our data (and clear out the trash)!

First bring in the data from a reliable source (Wikipedia):

*To get the Wikipedia data, Google **List of generation I PokÃ©mon**, or import the Excel file in the above folder*

Load this into the query editor and get rid of a couple of columns:

*The **Notes** column is gumpf and the idea of **Type(s) Secondary** is offensive. We've also moved the **National Pokedex number** column.*

Next get rid of any *Pokémon* who didn't first appear in **Red and Green**.

*This can been done by applying a filter to the top of the **First appeared** column.*

Finally to make our list completely free of any non-originals do a find and replace to remove any reference to **Mega Evolution**:

*The very idea that **Venusaur** can evolve is just ridiculous and this stupid idea of mega forms has to stop!*

Since we no longer need the **First appeared column,** delete it. The column was only there to remove non-essential *Pokémon*. Now close and apply to save your changes:

National P ↕	English name ▼	Japanese name ▼	Type(s) Primary ▼	Evolves into ▼
1	Bulbasaur	Fushigidane	Grass	Ivysaur (#002)
2	Ivysaur	Fushigisou	Grass	Venusaur (#003)
3	Venusaur	Fushigibana	Grass	Does not evolve
4	Charmander	Hitokage	Fire	Charmeleon (#005)

We millennials might not have houses, but we do have avocado toast and PokÃ©mon!

Save this as **There are only 151**, then close it down.
