To start, if you haven't already done so run the script in the above folder to generate the **MAM** database (not for commercial use or copying).

Not much help for this one! Using the MAM relationship diagram as a guide, construct the following data model:

These should be the only fields visible, but you will need to connect to ten tables in total.

Using this, create the following pivot table:

Sum of Quantity	Column Labels			
Row Labels	Factory Outlet	Retail Park	Shopping Centre	Shopping Park
Amphibian	119	847	1931	120
Bird	418	2941	6849	402
Mammal	619	4373	9641	590
Reptile	396	2915	6830	440

*The pivot table shows the total quantities sold in the **North** and **North-West**.*

Save this workbook as **Too many tables**, then close it down.
