Create a new Power BI Desktop file, and load into it sightings of whales and porpoises from the Whale and Dolphin Trust. You can use the link on this page.
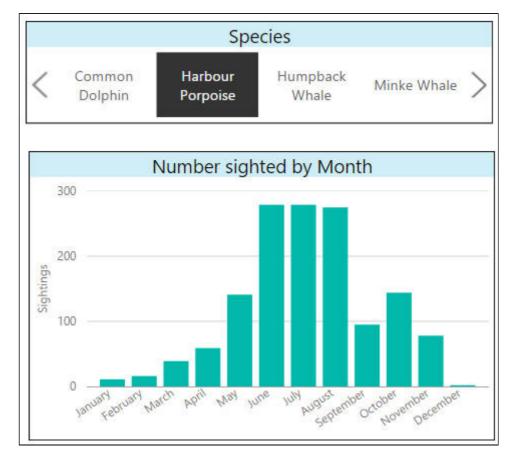

> *if you haven't got an Internet connection, or want to ensure you see exactly the results in this exercise, load data from the CSV file in the above folder instead.*

Create a slicer based on the data allowing you to choose the species sighted:

This slicer has horizontal orientation (although you can probably see that yourself).

Now add a chart comparing sightings by month, but restrict this by choosing the slicer species shown:

*Apply a filter to your visualisation so that it omits any sightings by people called **Jan**.*

Save this workbook as **Sense of porpoise**, then close down the Power BI instance containing it.
